Change of meteorological factors throughout years causes different reactions of wheat genotypes in terms of trait expression. Effects of environmental factors (sum of active temperatures, total precipitation and insolation) on heading time and plant height were analysed in twenty-seven wheat genotypes of different geographical origin from 2009-2013. The selected genotypes were classified into three groups according to the heading time (early, medium early and late), and the height (low, medium or high). Canonical correlation analysis was used to determine the interdependence between environmental factors and wheat phenotypic traits. Within all three groups for plant height, Eigen value of the first canonical factor explained 86.9-98% of the variability, indicating one predominant factor in the expression of this trait. Within the groups for earliness, Eigen value of the first canonical factor explained 64.9-76.3% of the variability, indicating more predominant factors in the expression of this trait. The coefficient of Canonical correlations (r) for plant height (0.50-0.64) showed a significant interdependence of all three groups of genotypes with all environmental factors used as dependent variables. Unlike height, in genotypes differing in earliness r differed significantly as an indicator of interdependence with the dependent variable. Specifically, in the early genotypes highly significant value was observed ($r=0.81$), in the medium early significant ($r=0.46$), while in the late genotypes the value was not significant ($r=0.23$). Since both analysed traits are determined by reduced height genes (Rht) and photoperiod genes (Ppd), this study accurately indicates their expression in different environmental conditions.

Allelopathic effects of three moss species on seed germination of *Lactuca sativa*

Although bryophytes represent the second most diverse group of land plants, little is known about their allelopathic interactions with other plants. The fact that despite their small body some of them can form large colonies, excluding other plants, indicates that allelopathy may be an important strategy in their competition for resources. To screen for allelopathic substances, we tested the aqueous extracts of the mosses *Abietinella abietina* (Hedw.) Fleisch., *Leucodon sciuroides* (Hedw.) Schwägr. and *Homalothecium sericeum* (Hedw.) Schimp. against seed germination of *Lactuca sativa* L. All moss species were collected in Pešter plateau, in the springtime 2014. Thirty seeds were put on double-layered filter paper in each Petry dish, supplied with 4 mL of moss extract of different concentrations and incubated for three days. Four replicates were made for each concentration (3% and 30%) and for the control (0%). At 3% concentration, statistically insignificant increase in germination rate was observed for *A. abietina* and *H. sericeum* extracts compared to that of the control group. In contrast, all aqueous extracts of 30% concentration inhibited seed germination, but only *H. seri-*
