WELCOME NOTES

The parasitic angiosperm broomrape (*Orobanche cumana* Wallr) causes economic damage in sunflower production in a number of countries around the world, but especially in Central and Eastern Europe, Spain, Turkey, Israel, Iran, Kazakhstan, and China. For almost a century, there has been a constant tug-of-war between sunflower breeders and *Orobanche cumana*, with frequent changes in which side has the upper hand. Almost as soon as the breeders find a source of resistance to the latest race of the pathogen, broomrape responds by evolving into another virulent race. The development of resistant cultivars as well as optimized managing strategies is a high priority in controlling this parasite, over the world.

This is the 5th specific symposium on broomrape in sunflower, after those held in Turkey in 2008, Moldova in 2011, Spain in 2014 and Romania, in 2018.

The symposium is organized by Trakya University and International Researchers Association in cooperation with the International Sunflower Association (ISA). The symposium will be held in Megasaray Westbeach Hotel, Antalya, Turkey, on November 1-3, 2023. The symposium covers all aspects related to broomrape parasitisms in sunflower, including parasite biology, physiology, parasite-host interaction, the racial status of broomrape, genetic resistance, molecular breeding, chemical control using herbicide-tolerant, and integrated management.

The symposium gathered sunflower scientists from around the world, and present their recent achievements. The organizers also invited relevant stakeholders to provide a view on the broomrape situation around the world as well as prospects to overcome the limitation for sunflower production, imposed by this parasitic weed.

There are 18 oral presentations and 8 poster presentations. There will be 146 participants from 18 countries from the world.

We would like to thank all of you for joining this conference and we would like to give also special thanks to our sponsors and collaborators for giving us a big support to organize this event.

Prof Dr Yalcin KAYA
Head of the Organizing Committee

ORGANIZING COMMITTEE

NAME	INSTITUTION	DUTY
Prof Dr Yalçın KAYA	Trakya University	Head of Committee
Assoc Prof Dr Necmi BEŞER	Trakya University	Vice Chair
Emrah AKPINAR	Trakya University	Congress Secretary
Dr Leonardo VELASCO	Inst. Sustainable Agric. CSIC, Spain	Member
Dr Maria PACUREANU-JOITA	Romanian Acad, Res. Studies Center for Agroforest Biodiversity	Member
M. İbrahim YILMAZ	Trakya Agricultural Research Institute	Member
Dr Göksel EVCİ	Trakya Birlik	Member
Dr Veli PEKCAN	Trakya Seed Co, TURKEY	Member

ABSTRACT

Sesquiterpene lactones (STL) are a group of natural compounds found in various plant species, including sunflowers (*Helianthus* spp.), and they have been studied for their potential role in allelopathy and defense against pests and pathogens. Allelopathy refers to the ability of certain plants to release chemicals that affect the growth and development of neighboring plants and organisms. In the context of sunflower broomrape (*Orobanche cumana*) and sunflowers, STLs have been of particular interest due to their potential role in inhibiting the growth of the broomrape parasite. Some STLs have been shown to possess allelopathic properties, which means they can influence the germination and growth of other plants, potentially including parasitic plants like sunflower broomrape. Research has suggested that certain STLs found in sunflowers may exhibit inhibitory effects on the germination and growth of sunflower broomrape seeds. These compounds could potentially be released from the sunflower roots and into the soil, creating a hostile environment for the parasite. However, the effectiveness of sesquiterpene lactones in controlling sunflower broomrape is still an active area of research, and their practical application as a management strategy requires further investigation. In recent years, secretion of Sesquiterpene Lactones (STLs) from sunflower roots has been found to trigger the germination of broomrape seeds. The genes encoding the enzymes (*HaGAS*, *HaGAO*, *HaG8H*, *HaCOS*) functional in STL biosynthesis in sunflower have been well characterized. CRISPR-Cas9 is a powerful genetic editing tool that has been used to modify specific genes in various organisms, including plants, for a range of purposes, including crop improvement and pest resistance. In the light of all these information, genes of the enzymes that catalyze the production STLS was aimed to knockout with CRISPR/Cas9 technique in the study. It has been hypothesized that mutant sunflower lines developed in this way will have full resistance to broomrape. The sequences of four genes (*HaGAS*, *HaGAO*, *HaG8H*, *HaCOS*) encoding the enzymes functional in STL biosynthesis were retrieved from the database and processed with CRISPR-P 2.0 software to find out the best guide RNAs (gRNAs) that can target exon parts of the genes. By this way, four best gRNAs (one gRNA for each gene) were selected for simultaneous targeting of the first exon of the genes. All gRNAs were then transferred into a Cas9 containing agrobacterium plasmid

(pHSE401) by using golden gate cloning. gRNA/Cas9 containing vectors were then inserted into agrobacterium rhizogenes and positive colonies were verified with colony PCR. The seed, cotyledon and hypocotyl explant of the sunflower genotype (NS3) was then treated with A. rhizogenes to insert of the gRNA/Cas9 into explants and root formation. Rooted mutants explants were then put into broomrape seed containing tissue culture media. The results indicated that 79% of the mutant roots have high resistance to broomrape. After DNA isolation, the target genes were amplified with PCR and sequenced to see the CRISPR-mediated mutation in the genes. among the broomrape resistant rooted explants 83% of them were recorded to carry mutation in the gene of interest. This is the first study developing broomrape resistant sunflower genotypes by using CRISPR genome editing system. Optimization of CRISPR mediated gene transfer and regeneration protocol will fasten and made important contribution to sunflower breeding. Genome editing-based strategies used to enhance crop resistance to parasitic weeds and its prospective applications will be discussed in the congress.

The project was supported financially by the Scientific and Technological Research Council of Türkiye (TÜBİTAK) with a project number; TOVAG-122O340
